I can give you: * A **minimal set of Java methods** (like top 15 only) * And where each one is used in coding problems 👉 That way you don't feel overwhelmed at all.
yes

Perfect — this is exactly what you need right now 👍
I'll give you a **small, powerful toolkit (only ~15 things)** that covers most coding problems.

👉 Don't try to learn everything. Just master these.

🧰 Core Java Toolkit (Beginner → DSA Ready)

🔹 1. Strings (MOST important)

✅ Basics

```
s.length()
s.charAt(i)
```

👉 Use for:

- looping through string
- accessing characters

✅ Modify / compare

```
s.toLowerCase()
s.toUpperCase()
s.equals(str)
```

👉 Use for:

- case-insensitive problems
- comparing strings (VERY common mistake area)

✅ Substring

```
s.substring(start, end)
```

👉 Use for:

- slicing strings
- palindrome / substring problems

✅ Character checks

```
Character.isLetterOrDigit(ch)
Character.isDigit(ch)
Character.isLetter(ch)
```

👉 Use for:

- cleaning strings
- validation problems

🔹 2. Arrays

✅ Basics

```
arr.length
```

👉 Use for loops:

```
for(int i = 0; i < arr.length; i++)
```

✅ Sorting (VERY useful)

```
Arrays.sort(arr);
```

👉 Use for:

- two pointer problems
- finding pairs

🔹 3. ArrayList

✅ Basics

```
list.add(x)
list.get(i)
list.size()
list.remove(i)
```

👉 Use for:

- dynamic arrays
- storing results

🔹 4. HashSet (for uniqueness)

```
HashSet<Integer> set = new HashSet<>();
set.add(x);
set.contains(x);
```

👉 Use for:

- duplicates
- fast lookup

🔹 5. HashMap (VERY IMPORTANT)

```
HashMap<Integer, Integer> map = new HashMap<>();

map.put(key, value);
map.get(key);
map.containsKey(key);
```

👉 Use for:

- counting frequency
- storing pairs

🔹 6. Loops (your main weapon)

```
for(int i = 0; i < n; i++)
while(condition)
```

👉 Everything depends on this.

🔥 How these combine in real problems

Example 1: Count frequency of characters

```
for(int i = 0; i < s.length(); i++){
    char ch = s.charAt(i);
    map.put(ch, map.getOrDefault(ch, 0) + 1);
}
```

Example 2: Check palindrome

```
int i = 0, j = s.length() - 1;

while(i < j){
    if(s.charAt(i) != s.charAt(j)) return false;
    i++; j--;
}
```

Example 3: Remove non-alphanumeric

```
if(Character.isLetterOrDigit(ch)){
    // keep it
}
```

🧠 Final strategy (THIS is the key)

🎯 You only need:

```
Strings → length, charAt
Array → length
ArrayList → add, get, size
HashMap → put, get
Character → isLetterOrDigit
```

👉 That's like **80% of coding problems**

🚀 How to master this (simple plan)

Daily (30–60 min):

1. Pick 1 problem
2. Use ONLY these tools
3. Repeat patterns

💡 Most important mindset

You're not learning:

> ❌ Java methods

You're learning:

> ✅ Problem-solving patterns

If you want next step, I can give you:
👉 **10 beginner problems** where each of these is used (perfect practice set)
